

User manual

1.5.2

Keep your customers in mind.

Complete guide to 1.5.2. Includes inactivity and periodic follow-up, filtered navigation and the full and Demo versions.

Official 1.5.2 edition. Full version and Demo in one package.

CONTENTS

- 01 / Memora and getting started
- 02 / Creating and editing records
- 03 / Returning customers and new cases
- 04 / Statuses, priority and follow-up
- 05 / Search, sort, filter and archive
- 06 / Channels, comments and translation
- 07 / My messages: reusable templates
- 08 / My summaries: create and reuse
- 09 / Exports and local backup
- 10 / Google Drive and local storage
- 11 / Preferences, help and maintenance
- 12 / Data deletion and quick checklist
- 13 / Full version and Demo

Demo limits are explained in chapter 13 and shown in the app. The full version keeps its features.

01 / Memora and getting started

Memora helps record conversations and cases. Its core purpose is to show what needs attention through inactivity or periodic review. It does not manage customers automatically, make commercial decisions or send messages on its own. In Pro you complete your profile; Demo only asks for your name (chapter 13).

First launch

- Complete your profile when you first open Memora. Your name is required; document details, company and WhatsApp are optional.
- The welcome tour introduces the app. You can replay it later from Profile.
- Your working data is primarily stored locally in this browser and device. Make a backup before switching devices or deleting site data. Three main areas
- Home: greeting, status cards, general performance, Smart Follow-up, records to review, and Messages and summaries.
- Records: active or archived cases, search, filters, sorting and record details.
- Profile: account information, general follow-up, language, theme, Google Drive, rules, exports, help and local data deletion.

IMPORTANT

One customer can have multiple separate cases. Each case has its own subject, status and history.

02 / Creating and editing records

Select New record to save an inquiry or case. Mobile and desktop forms use the same data model and let you choose a priority and follow-up rule.

Available fields

- Contact name, primary channel and contact details (phone number, handle or email).
- Up to three different channels per record, depending on your visibility settings.
- Subject, identifier type when applicable, customer number or other identifier, status and comments.
- Priority: Normal, High or Urgent.
- Follow-up: the general inactivity limit or one specific to this case.

Validation

Memora checks plausible international phone, email and social-handle formats. Format validation does not confirm that a phone number or account actually exists. Do not repeat the same channel within one case; you can use the same customer contact for a different case.

Editing

Open a record from Records and choose Edit. Saving real changes restarts inactivity follow-up, but not a periodic review period. Select Reviewed after checking the case to explicitly confirm a review.

IMPORTANT

Before archiving or deleting, check the subject carefully: the same customer may have several different records.

03 / Returning customers and new cases

Predictive customer lookup identifies possible existing customers as you type a name or contact details. You do not have to reuse an old case.

Working with a match

- Start typing a name or contact value in the form. Predictive results display possible matches.
- Select a match. Memora shows the customer and related cases.
- Open an existing case or choose to create a new case using known customer information.
- For a new case, check the copied information and enter the new subject, status and comments before saving.

Why this matters

The same customer number may correctly appear on several cases for one person. The identifier belongs to the customer; each record represents a distinct conversation, sale, inquiry or follow-up.

IMPORTANT

A suggested match is not identity verification. Check the details before reusing them if two people have similar names or shared contact details.

04 / Statuses, priority and follow-up

Statuses describe each case: New inquiry, Information sent, Waiting for customer, Waiting for internal response, Closed, Lost and Archived. Closed, Lost and Archived do not appear in Follow-up Required.

Priority and special follow-up

- Normal uses the general Profile setting. You can enable special follow-up manually without changing priority.
- Choosing High or Urgent opens the special configuration. Memora assigns no deadline: enter a whole number from 1 to 365 and choose Hours or Days.
- Opening an older record preserves its rule. Returning to Normal after automatic activation uses the general rule; a manually chosen rule may remain enabled.

A / Inactivity

Example: 12 hours without activity. The case needs attention once that time has passed since its effective activity or review. Saving real changes or selecting Reviewed restarts the classic interval.

B / Periodic review

Example: review every 2 days. The period starts when enabled and becomes due even if there is activity. Editing the name, subject, status, comments, priority or interval does not confirm a review. Changing the interval preserves the starting date; disabling and enabling it starts a new period.

Reviewed

Select Reviewed after checking the case. It restarts the applicable period without changing status or sending messages. For periodic review, this is the explicit confirmation that begins the next period.

Reading the card

The clock block shows the rule: "Inactivity review / Interval: 3 hours" or "Periodic review / Every 2 days". "Overdue by 30 min" means elapsed time since the deadline, not the configured interval. Before the first minute it says "Review pending"; afterwards it uses whole minutes, hours or days.

IMPORTANT

Follow-up updates within the app. It does not create system notifications, decide what to do next or contact the customer.

05 / Search, sort, filter and archive

The Records view offers general search for names, phones, subjects and other stored information. Advanced filters include channel, identifier, status and comment text.

Sorting is separate from filtering

- Newest first or Oldest first, based on the available creation date.
- Name A-Z or Name Z-A.
- Customer number ascending or descending. Records without a customer number appear after numbered ones.
- Your sorting choice persists when you apply filters: sorting is applied to the visible results.

Active and archived views

View Archived opens archived cases and lets you restore them to the active list. Cards retain the latest comment, creation and review dates, and the usual contact buttons. In Profile you can enable automatic archiving of Closed or Lost cases after 30 days. Archiving is not deletion.

IMPORTANT

If a record seems missing, check the selected filters and whether you are in Active or Archived view.

General Performance is now interactive

- Active opens Records using the original counter: excludes Lost and Archived, and includes Closed.
- This month filters by creation date and the device's local month. It includes archived records counted by the indicator.
- Top channel counts all three channels on all records, including archived records, and opens those using the most frequent channel.
- Existing filters and sorting work together in these views. "Return to normal list" removes the special view and clears filters while keeping the sort order.

06 / Channels, comments and translation

A record can use WhatsApp, Instagram, Email, LinkedIn, Facebook and Telegram. Store different channels for the same customer and use the regular buttons to open the appropriate external service.

Comments

- Write a note in the form and select Add.
- Edit or delete notes and consult the comment history inside the record.
- When present, the most recent comment also appears on record cards and follow-up entries.
- Memora preserves exactly what you typed, even if you change the interface language.

Translate text

Translate text opens an external translation service with the selected comment. It does not modify the saved original or automatically translate comments inside Memora. Consider the text's privacy before sending it to an external provider.

WhatsApp

The regular contact buttons open the corresponding service. Memora never sends messages on your behalf. Reusable templates are managed on Home under My messages.

IMPORTANT

Opening a link depends on the target app or website. Message delivery and recipient identity are handled by the external service.

07 / My messages: reusable templates

On Home, below the greeting, select My messages under Manage messages and summaries. The library supports text for any channel, not just WhatsApp.

What you can do

- Create a named message for WhatsApp, Instagram, Email, LinkedIn, Facebook, Telegram, all channels or a custom channel.
- Search messages and filter by channel.
- Use, edit, duplicate or delete a saved template. Duplicate names receive a sequential suffix.
- Choose a record when using a template, edit the completed text and copy it.

Available variables

The exact tags are {nombre}, {asunto}, {canal}, {empresa}, {telefono} and {numeroCliente}. Selecting a record fills these tags with available values. Without a selected record, the original template remains unchanged.

Example

A template such as “Hi {nombre}, have you reviewed the information about {asunto}?” can be reused for different customers. Always check the completed text before copying.

IMPORTANT

Memora copies text only at your request. It does not send automatic messages to any network.

Messages and Summaries have independent searches, filters, results and item actions. The shared backup of both libraries remains clearly labeled.

08 / My summaries: create and reuse

Use My summaries from the same Home panel. Summaries differ from message templates: they store objective notes or your own text, ready to copy, share or use later. Two creation methods

- New summary: enter a title and your own text, then choose Sales, Inquiries, Follow-up or Other.
- From a record: select a case. Memora proposes a factual draft using available customer details, subject, status, priority, channel, review date and latest comment. Edit it before saving.

Managing summaries

Search by name or text, filter by category, and use Copy, Edit, Duplicate and Delete. You can optionally assign a reference channel. Summaries are managed in their own library, not with extra action buttons on customer cards. Using a saved summary Select a record if you need to fill placeholders, review the editable text and copy the result. A saved summary is your stored text: it is not automatically updated when the source case changes.

IMPORTANT

Drafts are based on stored record data. Memora does not use generative AI to invent information.

Messages and Summaries have independent searches, filters, results and item actions. The shared backup of both libraries remains clearly labeled.

09 / Exports and local backup

Profile > Smart Export provides downloads for your data. If you want a particular selection, set up the appropriate Records view and filters first.

Export options

- Excel (.xlsx): creates a real workbook for the active or filtered view.
- PDF: generates a report for the active or filtered view, using the selected interface language for labels.
- Full JSON: downloads the array of records. By itself it does not include your message and summary library.
- Complete backup + manifest (.zip): local package containing records, the manifest and your library.

Inside the ZIP

- memora_backup.json: records and their stored information.
- memora_backup_manifest.json: version, date, record count, counts by status and library item counts. The manifest itself contains no contact or comment text.
- memora_biblioteca_151.json: your saved messages and summaries.

Library portability In Messages and summaries, use Export library and Import library to save and retrieve its dedicated JSON file. Import merges items without erasing existing ones and avoids duplicate content.

IMPORTANT

The ZIP is an archive, not a one-click full restoration feature. It does not contain every browser preference and should not replace occasional recovery checks.

10 / Google Drive and local storage

Connect Google Drive from Profile in the PRO environment to save or restore cloud records. Auto-save after changes is also available while the connection is active.

Actual scope of Drive backup

- Drive saves records as memora_backup.json and may save a companion manifest.
- The current Restore from Cloud action restores records. It does NOT automatically restore your messages and summaries.
- Export and import the library separately, or extract its JSON from the downloaded local ZIP, to protect that content.

Offline use

Memora is a PWA and may cache app files. Records and library items are stored locally in the browser. Clearing site data or moving to another device without backup can erase your working data. A practical rule Before replacing your phone, reinstalling your browser or performing a reset, save the ZIP archive and verify that it includes the three JSON files.

IMPORTANT

Real Google authorization and recovery require a working connection. Confirm that an actual backup exists before relying on it.

11 / Preferences, help and maintenance

Profile provides your details, general follow-up limit, channel visibility, language, appearance, automatic rules, backups and diagnostic information.

Languages

Choose Spanish, English, Portuguese or Automatic. Automatic uses the main device language when supported and falls back to Spanish otherwise. Navigation, labels and reports change; names, subjects, comments and templates typed by you are never silently translated.

Appearance and diagnostics

- Switch between light and dark appearance in Profile.
- System Diagnostics displays the version, device type, browser and approximate local record storage size.
- Clear PWA Cache helps refresh older app files after a deployment. It is not equivalent to deleting records or resetting Memora.

Help

The collapsible Help panel provides quick explanations. Download full manual and Replay welcome remain visible below it, even when Help is collapsed. The manual download follows your selected language.

IMPORTANT

If an update looks outdated: check the version in Diagnostics, clear the PWA cache and reload. Do not clear site data without a backup.

12 / Data deletion and quick checklist

In Pro, Hard Reset deletes Pro records, settings and libraries in this browser with the confirmations listed. Demo uses Reset Demo and preserves Pro data. Pro Hard Reset does not delete the separately stored Demo data.

Hard Reset confirmation

- Type BORRAR MEMORA when using Spanish, DELETE MEMORA in English or APAGAR MEMORA in Portuguese.
- You must accept a second confirmation. Canceling avoids deletion.
- The reset clears Memora's cache and restarts the onboarding flow. The default starter templates may reappear on a fresh installation.
- The local reset does NOT delete downloaded ZIP files or cloud files already stored in Google Drive.

Before deploying or updating

- Save a local ZIP and, if applicable, verify your latest real Drive backup.
- Open a known case, then create another for the same customer and check the identifier.
- Test sorting with filters and custom follow-up using hours and days.
- Create a test message and summary, export them and verify they can be imported.
- Confirm Help downloads the 1.5.2 manual for the chosen language.

IMPORTANT

Never use Hard Reset as an update method: it is an intentional local deletion and can destroy unbacked data.

13 / Full version and Demo

One package

Memora 1.5.2 includes the full version and Demo in a single ZIP. It keeps the original 1.5.1 rule: a hostname containing “demo” opens Demo; other hostnames open the full version. The landing page can link to either address without an in-app selector. The selection saved in previews no longer changes the mode.

Separate data

The full version keeps your existing data. Demo has its own profile, records, libraries, preferences and counters. Your full-version records and Google Drive authorization are not copied to Demo.

First Demo entry

It only asks for your name and displays “Demo user”. Five fictional cases and a sample message and summary are included. Home explains the trial and shows current allowances. Profile lists every maximum. Example text and data you enter are never automatically translated.

Demo limits

- Up to 15 records in total, including the five examples and archived records. Deleting frees up space; archiving does not.
- Up to three PDF and three Excel downloads, with separate persistent counters. Empty views and generation errors use no allowance. Downloading this manual does not count.
- Up to five message templates and three summaries, including examples. Creation, duplication and import respect each maximum.
- You may edit, copy text and mark Reviewed at the limits. An import exceeding a maximum is rejected entirely without changing the libraries.
- Google Drive is disabled and shown as a full-version feature. JSON and local ZIP backup remain available.

Reset Demo

Select Reset Demo in Profile. You can cancel. Confirming restores the five examples, sample libraries and limits. Your Demo changes and creations are deleted. Your name, language and theme remain; full-version data is not deleted.

Update without deleting

Back up and replace all files from the same package at the same address, protocol and port. An existing Demo keeps its data and counters; updating does not reset it. Older libraries above a new cap are kept and further additions are blocked. Do not use Hard Reset to update.
